

Every one of the 28 St Jude CSTN models carries the same 10-mark panel plus WGBS and super-enhancer calls (CTCF only in the 2018 study). Right of the rule: what it does not contain at all.

■ active / elongation mark, or factor ■ DNA methylation absent
■ repressive mark or insulator ■ derived calls (super-enhancers)

Access: all of it requires a St Jude / EGA data access agreement. None of it is added to any atlas total — the same material is already counted once under EGA (F25). What the enumeration adds is this resolution, which EGA does not publish.

Entity calls are the St Jude data administrator's (email); the fusion partner is from the CSTN portal model table (T17). Both are recorded per track in T28.

Red label: SJOS010930 X1, which the administrator reports as withdrawn from CSTN and no longer available — its tracks are still drawn on the browser page and are shown faded.

Grey italic label: SJRHB010463 X16, which is on the browser page and in the portal as PAX3::FOXO1 but is absent from the administrator's list; the discrepancy is left standing.
