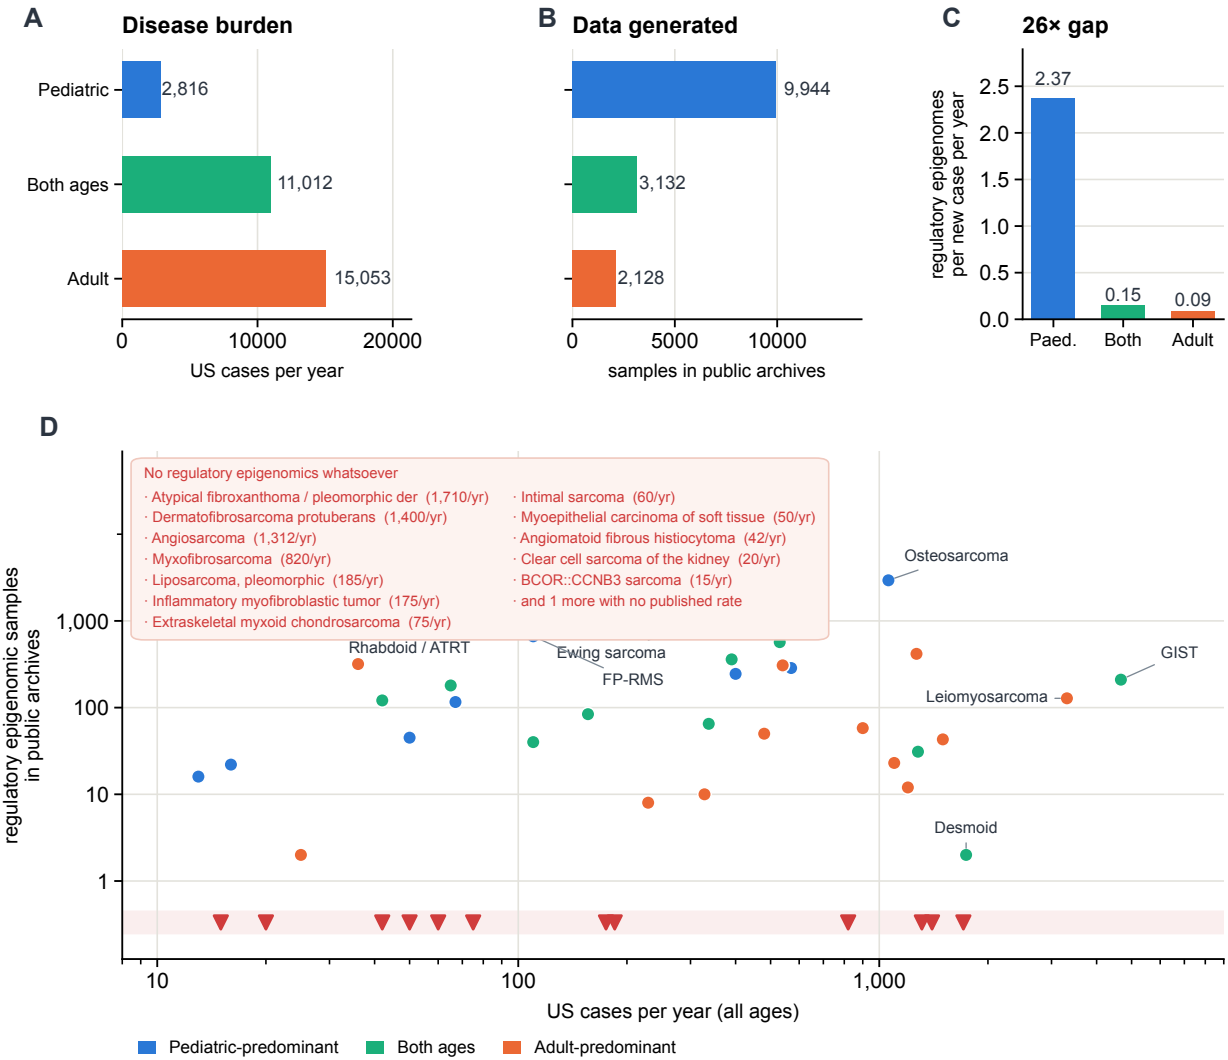
Adult sarcomas are the largest unmet opportunity: five times the burden, one twenty-sixth the data per case



Burden is US cases per year summed over the 45 named entities; topography-coded registry data excludes sarcomas coded to the organ they arise in, so the adult total is if anything an undercount.

Regulatory = ChIP-seq, CUT&RUN, CUT&Tag, ChIP-exo/chip, ATAC, scATAC, DNase, FAIRE, MNase, Hi-C, HiChIP, Micro-C, Capture-HiC, ChIA-PET and 4C, with input and IgG controls excluded.

Four further entities have no population rate published anywhere and are omitted from panel D only; they are counted everywhere else.

Panel D labels the four best-covered entities and the three highest-burden ones, each tied to its own point by a leader line.
