

The densest sarcoma epigenome resource that exists is complete, uniform — and entirely behind a wall.

Every one of the 28 St Jude CSTN models carries the same 10-mark panel plus WGBS and super-enhancer calls (CTCF only in the 2018 study). Right of the rule: what it does not contain at all.

active / elongation mark, or factor DNA methylation absent
repressive mark or insulator derived calls (super-enhancers)

Access: all of it requires a St Jude / EGA data access agreement. None of it is added to any atlas total — the same material is already counted once inside the EGA bar of Figure WP3. What the enumeration adds is this resolution, which EGA does not publish.

Entity calls are the St Jude data administrator's; the fusion partner is from the CSTN portal model table.

Red label: SJOS010930_X1, reported by the administrator as withdrawn from CSTN and no longer available — its tracks are still drawn on the browser page and are shown faded. Grey italic label: SJRHB010463_X16, which is on the browser page and in the portal as PAX3::FOXO1 but is absent from the administrator's list; the discrepancy is left standing.
