

Panel A denominator is the 9,834 de-duplicated sarcoma regulatory samples whose material of origin is stated: 91% are established cell lines and 7% are patient tumour. Samples recorded only as normal/reference, mouse model or unspecified are excluded from that denominator rather than assigned by guesswork; against the full de-duplicated set the cell-line share is 84%.

Panel C separates patient-derived material from cell lines deliberately — a synovial sarcoma organoid grown from a patient is not a decades-old line, and collapsing the two would call several entities a hard zero that are not.

Absence here means no public, entity-labelled deposit. It is not proof that no experiment was done: see Figure WP3.
